

Examples:

$\sin 210 = -\frac{1}{2}$
 $\cos 210 = -\frac{\sqrt{3}}{2}$
 $\tan 215 = -1$

Unit Circle:

- simplifies computation of trig ratios
- X-coordinates of a point on unit circle represent cosine, y-coordinate represents sine

Q: $\sin \theta \rightarrow +$
 $\cos \theta, \tan \theta \rightarrow -$
A: \cos, \sin, \tan of θ is positive
Q: $\tan \theta \rightarrow +$
 $\sin \theta, \cos \theta \rightarrow -$
A: $\tan \theta \rightarrow +$
 $\sin, \cos \rightarrow -$

$270 \leq 315 \leq 360$

$\cos \theta \rightarrow +$
 $\sin \theta, \tan \theta \rightarrow -$

$315 - 360 = -45$
 $\tan(-45) \rightarrow -1$
 $\tan(45) \rightarrow 1$

$0^\circ \rightarrow (1, 0)$
 $(\cos \theta, \sin \theta)$
 $(0, 1)$

$180 \leq 240 \leq 270$

$\cos 240 \rightarrow -$

$180 - 240 = -60$

$\cos(-60) \rightarrow -\frac{1}{2}$
 $\cos(60) \rightarrow \frac{1}{2}$

Negative and coterminal angles:

- Coterminal angles share same terminal arm in standard position
- Negative angles are measured clockwise from positive x-axis
- To find coterminal angles:

- Degrees: Add and subtract 360
- Radians: Add and subtract 2pi

60°

$60^\circ + 360^\circ = 420^\circ + 360^\circ = 780^\circ$
 $60 - 360 = -300^\circ - 360^\circ = -660^\circ$
 $60^\circ \rightarrow -60^\circ$

$\sin \theta \rightarrow -$
 $\sin 240 \rightarrow -$

$180 - 210 = -30$

$\sin 240 \rightarrow \sin(-30)$
 $\sin(30)$
 $\frac{1}{2}$
 $\sin(-30) = -\frac{1}{2}$

$\sin 30 = \frac{opp}{hyp}$
 $\sin 30 = \frac{1}{2}$

$\cos 60 = \frac{adj}{hyp}$
 $= \frac{1}{2}$

Coterminal angles of $30^\circ \rightarrow 0 \leq \theta \leq 720^\circ$

$30 + 360 = 390^\circ + 360^\circ$
 $30 - 360 = -330^\circ$
 390
 360
 750

Coterminal angle of $20^\circ \rightarrow -360 \leq \theta \leq 420^\circ$

$20 + 360 = 380^\circ + 360^\circ$
 $20 - 360 = -340^\circ - 360^\circ = -700^\circ$
 380
 360
 740
